Lower viscosity oils for improved efficiency

Fleet owners and managers are always looking for ways to improve the efficiency, reliability and performance of their fleets, to save money on the bottom line and also be compliant with ever-tightening environmental legislation.

Lower viscosity engine oils minimise friction between moving components of the engine and also reduce pumping and spinning losses.

Coupling the latest innovations in oil additive technology with some of the purest base oils, DURON™ next generation is designed to deliver improved oxidation resistance, shear stability and aeration control.

This can help fleets attain better fuel efficiency, and improving the efficiency of combustion also reduces the amount of emissions that are produced, helping to meet legislative greenhouse gas emission targets.

For more information on the next generation of DURON heavy duty diesel engine oils and how they can benefit your fleet operations, please visit: DURONthetougherthebetter.com
